                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                               र्
                                                                                                                                                                                   RESULT 641
                                                                                                                                                                                                                                                                                                                                                  The present sequence for universal PCR primer 220-11 is 1 of 8 universal Coligonucleotides (AAH23888-AAH23895) used in the isolation of the human SCF (stem cell factor) cDNA sequence. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73576) and the Collectides encoding them. SCF stimulate primitive progenitor cells including early haematopoletic progenitor cells. The invention also describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAB73578-AAB73597) and the oligonucleotides CC (AAH23859-AAH23887) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple CC myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, CC diseminated fungus disease, Pulminating septicaemia, malaria, vitamin CC sl2 and folic acid deficiency, pyridoxine deficiency, and vitiligo
                                                                                                                                                                                                                                                                           Query Match

SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02777-AAU02794) and the oligonucleotides (AAS04182-AAS04210) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, diseaminated fungus disease, Polminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-OCT-1989;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence for universal PCR primer 220-3 is 1 of 8 universal CC oligonucleotides (AAS04211-AAS04218) used in the isolation of the human CC SCF (stem cell factor) cDNA sequence. The present invention relates to CC novel stem cell factors (AAU02761-AAU02767, AAU02770-AAU02775, AAU02797) CC and the polynucleotides encoding them. SCF stimulate primitive progenitor CC cells including early haematopoietic progenitor cells. The invention also CC describes SCF peptides (AAU02777-AAU02797) and the oligonucleotides (CC (AAS04182-AAS04210) used in the isolation of human and rat SCF sequences. CC (CC The polynucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, CC disseminated fungus disease, Fulminating septicemia, witamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation CC disseminated such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for detecting hepatic cell proliferative disorders. The method comprises detecting a methylated CpG-containing glutathione-S-transferase (GST) nucleic acid (I) in a hepatic specimen or a biological fluid, where a methylated GST nucleic acid is indicative of a hepatic cell proliferative disorder. The method can be used to diagnose hepatic cellular carcinoma, and to monitor progress of its treatment. Increasing the level of GST is useful in the treatment of liver cancer, in humans or animals. The method can detect the early stages of tumourigenesis in liver cells simply. The present sequence represents a PCR primer which is used in the amplification of the human glutathione S-transferase pi gene (GSTP1) promoter in an example from the present invention for mapping somatic GSTP1 CpG island DNA hyperethylation changes by genomic sequencing after bisulfite treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; stem cell factor; SCF; haematopoietic progenitor cell; blood disorder; Hodgkin's disease; vitamin B12; folic acid deficiency; hypopigmentation disorder; viral disorder; AIDS; PCR primer; ss.

The sequence is described in an invention relating to novel stem cell factors, the polynucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia, malaria, vitamin B12 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS

The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia, malaria, vitamin Bl2 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS Seguence 20 nm. ^ *
                         Peroxisome proliferator-activated receptors (PPARB) are members of the nuclear hormone receptor subfamily of transcription factors. The preser invention relates to antisense oligonucleostides, targeted to a nucleic acid molecule encoding human PPARgamma, which specifically hybridises with and inhibits the expression of human PPARgamma. The present sequer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence for universal PCR primer 220-11 is 1 of primers (AAS10435-AAS10453) used to amplify various portions SCF CDNA sequence. The sequence is described in an invention
                                                                                                                                                                                                                                                                           Novel antisense compounds capable of modulating expression of peroxisome proliferator-activated receptor gamma useful for diagnosis, prophylaxis and treatment of diseases associated with expression of the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peroxisome proliferator-activated receptor gamma; transcription factor; nuclear hormone receptor; human; infection; inflammation; tumour; phosphorothioate; 2-methoxyethyl wing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human PPARgamma antisense oligonucleotide ISIS# 106035.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAF23717 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δ
                                                      The invention relates to inhibiting angiogenesis in a subject, comprising complication at least one antiangiogenic nucleic acid molecule. Also coincluded is a kit comprising a first container housing the antiangiogenic curvaleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is cuseful for inhibiting angiogenesis associated with solid tumour growth, curvalent to the container of the container. The method is curvalent for inhibiting angiogenesis associated with solid tumour growth, curvalent for inhibiting angiogenesis associated with solid tumour growth, curvalent for inhibiting angiogenesis described arthritis, psoriasis, curvalent grantinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, curvalent grantlation, intestinal adhesions, atherosclerosis, angiofibroma, curvalent grantlation, intestinal adhesions, atherosclerosis, soleroderma and chypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                    The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psociasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypetrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibropiasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               plaque neovascularisation; telangiectasia; haemophiliac angiofibroma; wound granulation; intestinal adhesion; at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is an oligonucleotide that binds specifically to cerotoxin type 2 (VT2) RNA. The 5' end of the oligonucleotide binds at CC position 365 of VT2 RNA. The oligonucleotide is used in a claimed process CC of detecting VT2 RNA, in which: a specific sequence of VT2 RNA in a CC sample is used as a template for cDNA synthesis using an RNA-dependent CC DNA polymerase; the RNA of the formed RNA/DNA hybrid is digested with CC ribonuclease H; the resulting single-stranded DNA is used as a template CC for production of a double-stranded DNA having a promoter sequence capable of transcribing RNA comprising the specific sequence or a cc sequence complementary to it employing a DNA-dependent DNA polymerase CC which produces an RNA transcription product in the presence of an RNA CC polymerase; and the RNA transcription product is then used as a template CC oligonucleotide capable of specifically binding to VT2 RNA, such as the CC oligonucleotide capable of specifically binding to VT2 RNA, such as the CC either the first or second oligonucleotide includes the RNA polymerase CC either the first or second oligonucleotide includes the RNA polymerase CC either the first or second oligonucleotide includes the RNA polymerase CC clinical examinations, public health examinations, food evaluations, and CC food poisoning reagent for cleaving, amplifying (preferably using a constant temperature nucleic acid amplification method) and detecting RNA or DNA, and is useful e.g. as a reagent for quantifying or diagnosing VT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                          ş
                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to methods for treating or preventing CC cancer, involving administering to a subject having or at risk of CC developing cancer immunostimulatory nucleic acids that induce expression CC developing cancer immunostimulatory nucleic acids that induce expression CC cell surface antigens and antibodies. The methods are useful for CC treating or preventing cancer such as basal cell carcinoma, bladder Cancer, bone cancer, brain and central nervous system (CNS) cancer, CC tissue cancer, cervical cancer, colon and rectum cancer, connective CC tissue cancer, cesophageal cancer, eye cancer, kidney cancer, larynx CC cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian CC cancer, stomach cancer, prostate cancer, rhabdomyosarcoma, skin Cancer, stomach cancer, testicular cancer, rhabdomyosarcoma, skin Cancer, stomach cancer, testicular cancer, and uterine cancer. The Cresent sequence is an immunostimulatory oligonucleotide described in the campilification of the invention
                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
   Synthetic

The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, stomach cancer, prostate cancer, rabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, osesphageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, stomach cancer, prostate cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the
The invention relates to a method for detecting 1 base polymorphism the sequence of a chromosome or its fragment in which a sample nucle acid is reacted with a reaction liquor containing a nucleic acid pri having a base adjacent to the polymorphic base at its 3'-end, one
                                                                                                                                                                                                                                                                   WPI; 2002-275727/32

The invention relates to a method of detecting a nucleic acid (NA) having at least 2 portions comprising: (a) providing nanoparticles (NP) with attached oligonucleotides (OGN), where OGN has a sequence complementary to the sequence of NA; (b) contacting NA and NP under conditions effective to allow hybridisation of OGN with NA; and (c) observing a detectable change brought about by hybridisation Of OGN with NA. The method is useful for detecting a nucleic acid from others and methods of nanofabrication. Detecting analytes such as nucleic acids and proteins are useful for the diagnosis of genetic, bacterial and viral diseases. The OGN-NP conjugates that use cyclic disulphide linkers improve the sensitivity of diagnostic assays. In particular assays using CGN-NP conjugates prepared using linkers comprising a steroid residue attached to a cyclic disulphide have been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       dideoxynucleotide corresponding to a polymorphic base having a distinguishable feature or its mixture, DNA polymerase and a composition required for its activity expression to detect the presence of taking dideoxynucleotide in the nucleic acid primer and to detect the type of the base to be specified. The method is used for detecting 1 base polymorphism on the sequence of a chromosome or its fragment. The present sequence is that of a PCR primer, useful in examples of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting nucleic acid, useful for diagnosis of genetic, viral or bacterial disease, comprises hybridizing nanoparticles with attached oligonuclectides to nucleic acid and detecting change brought about
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-AUG-2000; 2000US-0224631P.

yes story genetic, cyclic dieco
The invention relates to a method of detecting a nucleic acid (NA) having at least 2 portions comprising: (a) providing nanoparticles (NP) with attached oligonucleotides (GNN), where CGN has a sequence complementary to the sequence of NA; (b) contacting NA and NP under conditions effective to allow hybridisation of GGN with NA; and (c) observing a detectable change brought about by hybridisation of GGN with NA. The method is useful for detecting a nucleic acid, separating a selected nucleic acid from others and methods of nanofabrication. Detecting analytes such as nucleic acids and proteins are useful for the diagnosis of genetic, bacterial and viral diseases. The OGN-NP conjugates that use cyclic disulphide linkers improve the sensitivity of diagnostic assays. In particular assays using OGN-NP conjugates prepared using linkers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    found to be approximately 10 times more sensitive than assays employing conjugates prepared using alkanethiols or acyclic disulphides as the linker. The OGN-NP conjugates are stable allowing them to be used directly in PCR solutions. Therefore conjugates added as probes to a DN target to be PCR amplified can be carried through the 30 or 40 heating cooling cycles of the PCR and are still able to detect the amplicons without opening the tubes and causing contamination. ABK64981-ABK65055 represent nanoparticle-oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-AUG-2000; 2000US-0224631P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprising a steroid residue attached to a cyclic disulphide have been found to be approximately 10 times more sensitive than assays employing conjugates prepared using alkanethiols or acyclic disulphides as the linker. The OGN-NP conjugates are stable allowing them to be used directly in PCR solutions. Therefore conjugates added as probes to a DN target to be PCR amplified can be carried through the 30 or 40 heating cooling cycles of the PCR and are still able to detect the amplicons without opening the tubes and causing contamination. ABK64981-ABK65055 represent nanoparticle-oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       anaemia; myelosuppression; nerve damage; myeloproliferative disorder; infertility; neoplasia; myelofibrosis; myelosclerosis; osteopetrosis; metastatic carcinoma; acute leukaemia; multiple myeloma; sarcoidosis; Hodgkin's disease; lymphoma; Gaucher's disease; Niemann-Pick disease; Letterer-Siwe disease; refractory erythroblastic anaemia; Kala azar; Di Guglielmo syndrome; congestive splenomegaly; splenic pancytopaenia; disseminated fungus disease; Fulminating septicaemia; piebaldism; AIDS; acquired immune deficiency syndrome; malaria; military tuberculosis; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; piamond Blackfan anaemia; hypopigmentation disorder; vitiligo; PCR;
                                                                                                                                                                                              Novel non-naturally-occurring stem cell factor polypeptide, useful treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rat; stem cell factor; SCF protein; leucopaenia; thrombocytopaenia;

```

The present invention relates to novel non-naturally-occurring stem (factor (SCF) polypeptides having an amino acid sequence sufficiently duplicative of that of naturally-occurring SCF to allow possession of haematopoietic biological activity of naturally occurring SCF. Sequen

They CR are also useful for treating acquired immune deficiency in a human, nerve CC damage, neoplasia, infertility, myeloproliferative disorder, intestinal C damage in a mammal. SCF sequences are useful for preparing biologically CR active polymer polypeptide adduct, for enhancing transfection of early CR active polymer possible carcinoma, acute leukaemia, myelosclerosis, costeopetrosis, metastatic carcinoma, acute leukaemia, myelosclerosis, CC esteopetrosis, metastatic carcinoma, acute leukaemia, myelosclerosis, CR costeopetrosis, effactory erythroblastic anaemia, Di Guglielmo CR syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary CR splenic pancytopaenia, disseminated fungus disease, malaria, military tuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin B12 and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation CC disorders such as piebaldism, ANDS (acquired immune deficiency syndrome) CC and vitiligo. The present sequence is a PCR primer which is used for CC amplifying the 5' end of rat SCF cDNA. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence representing a universal oligonucleotide for SCF DNA is used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                            Stem cell factor; SCF; blood-forming system; blood cell disorder; hasmatopoietic system; metastatic carcinoma; acute leukaemia; multiple myeloma; Hodgkin's disease; lymphoma; malaria; vitiligo; refractory erythroblastic anaemia; miliary tuberculosis; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polynucleotide sequences encoding the SCFs, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of a human stem cell factor (SCF) polypeptide for disorders involving blood cells, such as leukemia, comprises mammalian cells comprising non-human SCF promoter DNA linked encoding the human SCF.
                                                                                                                                                                                                     04-OCT-1990;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence representing a universal oligonucleotide for SCF DNA is used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel stem cell factors (SCFs), polynuclectide sequences encoding the SCFs, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat
                                              Synthesis of polynucleotide useful during fabrication involves coupling nucleoside phosphoramidite and nucleoside and treating the product with an oxide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Production of a human stem cell factor (SCF) polypeptide for disorders involving blood cells, such as leukemia, comprises mammalian cells comprising non-human SCF promoter DNA linked
                                                                                                                                                                                                                                                                                 Synthetic
                                                                                                                                                                                                                                                                                                           Oligonucleotide synthesis; polynucleotide array; protecting group; oxidation; ss.

The present invention relates to a method of inhibiting skin inflammation associated with a skin disorder selected from psoriasis, atopic dermatitis and allergic contact dermatitis, which involves administering a composition containing delipidated and deglycolipidated Mycobacterium vaccae cells or M. vaccae culture filtrate. The skin disorder to be treated may also include alopecia areata, and skin cancers such as basal cell carcinoma. Squamous cell carcinoma and melanoma. The composition acts by inhibiting the Th2 immune response. The present sequence is a probe described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for the synthesis of a polynucleotide which involves coupling a second nucleoside to a first nucleoside through a phosphite linkage, where the second nucleoside has a non-carbonate protecting group protecting a hydroxyl, and exposing the product to a composition which concurrently oxidizes the phosphite formed to a phosphate and deprotects the protected hydroxyl of the second nucleoside. The method is useful for synthesizing the polynucleotides, for carrying out either 3' to 5' or 5' to 3' synthesis and for fabricating an addressable array of polynucleotides on a substrate. The present sequence is an oligonucleotide produced to demonstrate the method
                                                                                                                                                                                                                                                                                                                                                 Inhibiting skin inflammation associated with skin disorder e.g. psoriasis, by administering composition comprising delipidated and deglycolipidated Mycobacterium vaccae cells or Mycobacterium vaccae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Skin disorder; psoriasis; atopic dermatitis; allergic contact dermatitis; alopecia areata; skin cancer; Mycobacterium vaccae; melanoma; cytostatic; antipsoriatic; dermatological; antiinflammatory; antiallergic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
               CC two portions, involving providing nanoparticles having oligonucleotides CC attached to it, which has a sequence complementary to sequence of two CC portions of nucleic acid, contacting nucleic acid and nanoparticles, to CC allow hybridisation of oligonucleotides with two or more portions of CC nucleic acid, and observing a detectable change brought about by CC hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide CC conjugates (II) and the aggregate probe are useful for detecting two or CC more nucleic acids (from a biological source) having at least two or CC more nucleic acids (from a biological source) having at least two or CC more nucleic acids (from a biological source) having at least two or CC conjugates (II) and the aggregate probe are useful for detecting two or CC conjugates (II) are useful for structurally-modified natural or synthetic CC (I) and (II) are useful for fabrication, and for separating a selected CC (I) and (II) are useful for fabrication, and for separating a selected CC (I) and (II) are useful for fabrication, and for separating a selected CC (I) and (II) are useful for fabrication, and for separating a selected CC (I) and (II) are useful for fabrication, and for separating a selected CC (I) and (II) are useful for detecting an analyte (especially CC polyvalent analyte) in a sample. This sequence represents a CC polyvalent used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                    The invention describes a method of detecting (MI) a nucleic acid having two portions, involving providing nanoparticles having oligonucleotides attached to it, which has a sequence complementary to sequence of two portions of nucleic acid, contacting nucleic acid and nanoparticles, to allow hybridisation of oligonucleotides with two or more portions of nucleic acid, and observing a detectable change brought about by hybridisation. (MI), nanoparticles (I), nanoparticle-oligonucleotide conjugates (II) and the aggregate probe are useful for detecting two or more nucleic acids (from a biological source) having at least two or more nucleic acids (from a biological source) having at least two or portions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. (II) is useful for preparing a nanoprobe conjugate for detecting an analyte, and for detecting a nucleic acid bound to an electrode surface. (I) and (II) are useful for fabrication, and for separating a selected nucleic acid having two portions from other nucleic acids. (I), (II) and the aggregate probe are useful for detecting an analyte (especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SXS
                              The present invention describes a non-antibody protein, comprising a comparish describes an immunoglobulin-like fold, derived from a reference protein having an mutated amino acid sequence, where the non-antibody protein binds with a Kd at least as tight as 10 nM to a compound that is not bound as tightly by the reference protein. The non-antibody protein is useful as scaffolds for selecting or designing a protein framework with specific and favourable properties, e.g. for binding any antigen of interest, or for destroying or inactivating antibody molecules. The non-antibody protein is also useful in all areas where antibodies are used, e.g. research, therapeutic or diagnostic fields, and for screening novel binding proteins useful in the above-mentioned fields. The present proteins have thermodynamic properties superior to those of natural cantibodies, and can be evolved rapidly in vitro. The present proteins or antibody mimics exhibit improved biophysical properties, such as concentrations. In addition, these molecules are readily expressed and concentrations. In addition, these molecules are readily expressed and concentrations. In addition, these molecules are readily expressed and concentrations. In addition, these molecules are readily expressed and concentrations. In addition, these molecules are readily expressed and concentrations of in vitro translation systems (e.g. rabbit cretion). Furthermore, these proteins are extremely amenable to affinity maturation techniques involving multiple cycles of selection, e.g. in vitro selection using RNA-protein fusion technology, that the separation techniques involving multiple cycles of the present involving multiple cycles of the present sequence is used in the sequence is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ई
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 õ
                                                                                                                                                                                                                                                                                 The invention relates to a method of detecting a nucleic acid having two CC portions. The method involves providing nanoparticles having coligonucleotides attached to it which has a sequence complementary to sequence of two portions of nucleic acid, contacting nucleic acid and CC nanoparticles to allow hybridisation of oligonucleotides with two or more portions of nucleic acid and observing a detectable change brought about CC by hybridisation. The method and aggregate probes are useful for CC detecting two or more nucleic acids (from a biological source) having at CC least two portions such as viral RNA, bacterial or fungal DNA, a gene CC associated with a disease, synthetic or structurally modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction CC synthetic RNA or DNA, or a product of a polymerase chain reaction CC conjugate for detecting an analyte and for detecting a nanoprobe conjugate for detecting an analyte and for detecting a nucleic acid bound CC to an electrode surface. It is also useful for fabrication and for separating a selected nucleic acid having two portions from other nucleic acids. The present sequence is an oligo used to illustrate the method of the invention
                                                                                                                                            Query Match

                                                     S
                                                                                                                                                                                                                                                                                                      The invention relates to DNA sequences (I) that encode six specific plant CC proteins: (i) a protein (ABP60425) with mitochondrial carrier protein CC activity (IIa); (ii) a protein (ABP60426) with transferrin binding CC protein activity (IID); (iii) a protein (ABP60427) with receptor-like protein kinase activity (IIC); (iv) a protein (ABP60428) with belongation CC factor BF-2 activity (IIG); (v) a protein (ABP60429) with non-long CC terminal repeat retroelement reverse transcriptase activity (IIe); or CC (vi) a protein (ABP60429) with non-long CC sequences, derived ribozymes and antibecase activity (IIF). (I), also related CC sequences, derived ribozymes and antibecase sequences, expression vectors, CC encoded proteins and antibodies against the proteins, are used to produce CC plants with altered properties, including tolerance of overwatering. The CC immunoassays. Also (I) or their primer or probe fragments are used to immunoassays. Also (I) or their primer or probe fragments are used to conducible plant promoters, specifically for use in potatoes and the CC sequence that encodes (IId) is used to alter the translation profile in CC plants. Since (I) are derived from potato, their promoters and the CC improved tissue specificity and inducibility, and can also be used to control endogenous genes. The present sequence is that of a PCR primer CC used in the first strand synthesis of cDNAs derived from Potato
                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Potato; plant; mitochondrial carrier protein; elongation factor EF-2; transferrin binding protein; receptor-like protein kinase; helicase; non-long terminal repeat retroelement reverse transcriptase; overwatering; transgenic; reverse transcriptase; PCR; primer; 85.
                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and inhibitory sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA sequences from potato, useful for producing plants with altered properties, e.g. tolerance of flooding, also related proteins, antibodies

CC portions, comprises providing a type of nanoparticles (NP) having CC attached to oligonucleotides (O) (O) on each NP has a sequence CC complementary to sequence of at least 2 portions of NA), contacting NA CC and NP to allow hybridisation of (O) on NP with 2 or more portions of NA, CC and observing a detectable change brought about by hybridisation of (O) on NP with NA. The nanoparticle is useful for separating a selected concleic acid having at least 2 portions, from other nucleic acids, and CC using NP is useful for detecting any type of nucleic acids which may be used for disgnosis of disease and in sequencing of nucleic acids for CC using NP is useful for detecting any type of nucleic acids which may be used for disgnosis and/or monitoring of viral diseases (human immunodeficiency cruus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr CC virus, bacterial diseases, sexually transmitted diseases, inherited CC cell line authentication and for monitoring gene therapy. The method is cuseful in research and analytical laboratories in DNA sequencing and in the field to detect the presence of specific pathogens. Detecting nucleic acids based on observing a colour change with the naked eye is cheap, CC fast, simple and robust, and do not require specialised expensive cequipment. The present sequence is a nanoparticle (e.g. gold particles) can be a constrate the method of the invention of the inven

CC portions of nucleic acid, contacting nucleic acid and nanoparticle with two contacts of the oligonucleotide on the nanoparticle with two contacts of the oligonucleotide on the nanoparticle with two contacts of the oligonucleotide acid and contacts of the nanoparticle with two contacts of the oligonucleotide nanoparticle with concleic acid. The method is useful for separating a selected nucleic acid having at least two portions, from other nucleic acids and for detecting nucleic acids having at least two portions. The method is useful for contacts of disease and in sequencing of nucleic acids which may be used for diagnosis of contacts of the contact acids. Preferably, the method is useful for viral infections (human immunodeficiency virus (HIV), hepatitis virus, cytomegalovirus and Epstein-Barr virus), bacterial contacts of sexually transmitted diseases, inherited disorders, in the field to detect the presence of specific pathogens. Detecting nucleic acids based con observing a colour change with the naked eye is cheap, fast, simple cand contact and does not require specialised expensive equipment. ABX92123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          attached to oligonucleotides, where the oligonucleotide on each nanoparticle have a sequence complementary to a sequence of at least portions of nucleic acid, contacting nucleic acid and nanoparticle to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting nucleic acids having at least two portions involves use nanoparticles which have oligonucleotides attached to them that as complementary to portions of the nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mirkin CA,

This invention relates to a novel method for detecting a nucleic acid having 2 portions. The method comprises providing nanoparticles having oligonucleotides attached, where the oligonucleotide on each nanoparticle has a sequence complementary to a sequence of 2 portions of nucleic acid. The nucleic acid and nanoparticle are contacted to allow hybridisation of the oligonucleotide on the nanoparticle with two or more portions of nucleic acid and observing a detectable change brought about by the hybridisation. The method of the invention is useful for separating a selected nucleic acid having 2 portions, from other nucleic acids, and
                                                                                                                                   Detecting nucleic acids having 2 portions e.g. for detecting disease, comprises use of nanoparticles which have oligonucleotides attached them that are complementary to portions of the nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           virus detection; human immunodeficiency virus; HIV; hepatitis; herpes; cytomegalovirus; Epstein-Barr virus; bacterial disease; DNA sequencing; sexually transmitted disease; inherited disorder; forensic;

The method of the invention is useful for detecting any type of nucleic acids which may be used for diagnosis of disease and in sequencing of nucleic acids. Preferably, the method is useful for detecting nucleic acids for diagnosis and/or monitoring of viral diseases (human immunodeficiency virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr virus), bacterial diseases, sexually transmitted diseases, inherited disorders, in forensics, in DNA sequencing, for paternity testing, for cell line authentication, for monitoring gene therapy, etc. This method involves detecting nucleic acids based on observing a colour change with the naked eye so is cheap, fast, simple and robust, and does not require specialised expensive equipment. The present sequence represents a thiol modified oligonucleotide sequence used to demonstrate the method of the
                                  Detecting nucleic acid having two portions, by providing nanoparticles having oligonucleotides attached to it, contacting nucleic acid and nanoparticles to allow hybridization, and observing detectable change,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  *88888888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC sequences having two portions. The method involves providing act sequences having two portions. The method involves providing CC nanoparticles having oligonucleotides attached to them, which has a CC sequence complementary to sequence of two portions of nucleic acid, and constanting nucleic acid and nanoparticles, to allow hybridisation of CC oligonucleotides with two or more portions of nucleic acid, and observing a detectable change brought about by hybridisation. The method of the CC invention and the aggregate probes are useful for detecting two or more cc invention and the aggregate probes are useful for detecting two portions, CC such as viral RNA or DNA, bacterial or fungal DNA, a gene associated with CC alsease, synthetic, or structurally-modified natural or synthetic RNA CC or DNA, or a product of a polymerase chain reaction amplification.

CC Nanoparticles and nanoparticle-oligonucleotide conjugates of the invention are useful for nanofabrication, and for separating a selected convention are useful in forensics, DNA sequencing, for paternity CC biagnostic assays employing the nanoparticle-oligonucleotide conjugates of the invention improve the sensitivity of the nucleic acid detection CC assay. The present sequence represents a thiol modified oligonucleotide CC sequence used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 673
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for detecting a nucleic acid by contacting a nucleic acid with at least two types of nanoparticles having coligonucleotides attached, allowing hybridisation of the oligonucleotides con the nanoparticles, and observing a detectable change. The coligonucleotides on each nanoparticle have a sequence complementary to client respective portion of the sequence of the nucleic acid to be concluded in the method of the invention may be used for the detection of a concluder acid used in, e.g. research and analytical laboratories in DNA concluded in the field to detect the presence of specific pathogens, in the field to detect the presence of specific pathogens, in concluding a drug for treatment, and in homes and health centres for concludic acids based on observing a colour change with the naked eye. This concluded is cheap, fast, simple, robust and does not require specialised or consensive equipment. The present sequence represents a thiol modified coligonucleotide sequence used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

The oligonucleotides on the sequence of the nucleic acid. The method of the invention may be used for the detection of a nucleic acid used in, e.g. research and can be sequence of specific pathogens, in the doctor's office for quick analytical laboratories in DNA sequencing, in the field to detect the presence of specific pathogens, in the doctor's office for quick can be sequent, and in homes and health centres for inexpensive first-line screening. The inventive method of detecting nucleic acids based on observing a colour change with the naked eye are cheap, fast, simple, robust (the resgents are stable), do not require specialised or expensive equipment, and little or no instrumentation is required. The present sequence represents a thiol modified oligonucleotide sequence used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC portions and the distances between these are chosen so that when the camparticle-oligonucleotide conjugate binds the target sequence a CC detecting two or more nucleic acids (from a biological source) having at cleast two portions, such as viral RNA, bacterial or fungal DNA, a gene cc associated with a disease, synthetic, or structurally-modified natural CC or synthetic RNA or DNA, or a product of a polymerase chain reaction CC amplification. Nanoparticle-oligonucleotide conjugates of the invention are useful for preparing a nanoprobe conjugate for detecting an analyte, CC and for detecting a nucleic acid bound to an electrode surface. CC Nanoparticles and nanoparticle conjugates of the invention are useful for nepartion and for separating a selected mucleic acid having two CC portions from other nucleic acids. Diagnostic assays employing CC nanoparticle-oligonucleotide conjugates improve the sensitivity of nucleic acid detection methods and can be used to detect nucleic acids that are present in only small amounts in a sample. The invention also C conjugates are stable with tailored hybridisation abilities. These conjugates represents a thiol modified oligonucleotide sequence used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                            detectible change occurs. The method of the invention is useful for detectible through one mucleic acids (from a biological source) having at least two portions, such as viral RNA, bacterial or fungal DNA, a gene associated with a disease, synthetic, or structurally-modified natural or synthetic RNA or DNA, or a product of a polymerase chain reaction amplification. Nanoparticle-oligonucleotide conjugates of the invention are useful for preparing a nanoprobe conjugate for detecting an analyte, and for detecting a nucleic acid bound to an electrode surface.

Constraint for separating a selected mucleic acid having two partions from other nucleic acids. Diagnostic assays employing nanoparticle-oligonucleotide conjugates improve the sensitivity of nucleic acid detection methods and can be used to detect nucleic acids that are present in only small amounts in a sample. The invention also provides highly desirable nanoparticle-oligonucleotide conjugates. These conjugates are stable with tailored hybridisation abilities. The present sequence represents a thiol modified oligonucleotide sequence used to
                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel method for detecting nucleic acids. The method comprises providing nanoparticles with oligonucleotides attached to them, which have a sequence complementary to a sequence of two portions of nucleic acid, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with two or more portions of the nucleic acid, and observing a detectable change brought about by the hybridisation. The nucleic acid to be detected must have at least two portions and the distances between these are chosen so that when the nanoparticle-oligonucleotide conjugate binds the target sequence and properticity of the sequence and the distances between these are chosen so that when the nanoparticle-oligonucleotide conjugate binds the target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of nucleic acid having at least two portions, by contacting nucleic acid and nanoparticles under conditions, which allows hybridization of oligonucleotides on nanoparticles with at least two portions of nucleic acid.
                        Immunostimulatory nucleic acid #537.
